

# Gallery-controlled Na double well and interlayer-2DEG superconductivity

Model caveat:  $c$  is the CoO<sub>2</sub>-CoO<sub>2</sub> spacing of the anhydrous Na(Li)CoO<sub>2</sub> DFT series (this repo); the hydrate  $c$  values are placed on this axis as a rigid extrapolation (shaded beyond the DFT range). The hydrate galleries contain H<sub>2</sub>O, absent from the model; water screening is expected to shallow the Na well and pull the system back toward the critical point (see MODEL.md).
